# DemoBank QA Automation - Cost Breakdown

**Project:** CDF Agentic QA Hackathon
**Reporting scope:** Completed deterministic QA execution
**Date:** October 21, 2026

## 1. Executive Summary

The DemoBank QA pipeline evaluated 42 test scenarios using Python, Playwright, browser automation, API assertions, and PostgreSQL verification.

The execution did not require paid LLM API calls.

**Estimated paid LLM API execution cost: $0.00 USD**

This figure does not represent the total cost of developing or operating the project.

## 2. Cost Breakdown

| Cost Category | Usage or Estimate | Cost |
|---|---|---|
| Paid LLM API calls during QA execution | 0 calls | $0.00 |
| Paid LLM input tokens during QA execution | 0 tokens | $0.00 |
| Paid LLM output tokens during QA execution | 0 tokens | $0.00 |
| Python and Playwright | Open-source tooling | No software license fee |
| PostgreSQL | Local development database | No separately measured cost |
| Browser automation and local compute | Executed locally | Not measured |
| Development assistance and engineering time | Outside execution scope | Not measured |
| Electricity, hardware, and infrastructure | Local environment | Not measured |

## 3. Execution Metrics

| Metric | Result |
|---|---|
| Test scenarios evaluated | 42 |
| Passed | 38 |
| Failed | 4 |
| Unverified | 0 |
| Confirmed defects | 4 |
| Pass rate | 90.48% |

## 4. Cost Calculation

Paid LLM API cost = Input token charges + Output token charges

Because the deterministic QA execution did not use paid LLM API calls:

**Paid LLM API execution cost = $0.00 + $0.00 = $0.00 USD**

## 5. Scope and Limitations

- The $0.00 figure applies only to paid LLM API usage during deterministic QA execution.
- Local computing resources and infrastructure expenses were not measured.
- Development time and assistance costs were not measured.
- No autonomous LLM planning was performed during test execution.
- The estimate should not be interpreted as the total cost of the project.
